

# Street & Utility Improvements

## WHAT TO EXPECT DURING A FULL STREET RECONSTRUCTION

Construction is a key element in creating safe, sustainable, and beautiful communities. While there are many different types of construction projects, one cornerstone to maintaining city infrastructure is the full street reconstruction. This involves replacing underground utilities such as watermain, storm sewer and sanitary sewer, as well as the gravel roadway base, curb, driveways and pavement, and - in some cases - sidewalks. While each full street reconstruction is unique for each project area, there are certain processes and methods that can be expected for each project.

As a resident, you can expect the following process:

- Install erosion control measures
- Remove pavement
- Replace/rehabilitate underground utilities
- Excavate roadway
- Place new roadway base
- Install curb, driveways, and sidewalks
- Pave (which typically includes more than one layer)
- Establish turf
- Install roadway striping and signage

Contractors typically work from 7 a.m. to 7 p.m. Monday through Friday, with some Saturdays depending on the project. During these working days, there will be noise, mud, dirt piles, dust, and other construction-related activities. While it isn't possible to mitigate all of these issues, the contractor will try to limit these disturbances as much as possible, including spraying the road to control dust and filling in and grading muddy areas.

If you have further questions on how construction may impact you, please reach out to a project representative listed below.
